Welcome to use Handout-With-Script!

I'm Weizhou Pan, alternatively you can call me Joseph. ☺

INTRO

This is a demo slides for *Handout-With-Script*.

Handout-With-Script is a LATEX template for generating a handout with script for presentation.

2 / 11

Page 2

Handout-With-Script is a LATEX template for generating a handout with script for presentation. When you are writing a script, it can automatically insert the slide you already created in your slides file into your script. This is very handy for someone that need to practice his/her presentation with script and the slides at the same time.

In the following pages we will show how to use *Handout-With-Script* to write a script.

REQUIREMENTS

Requirements of *Handout-With-Script*
 ▸ pdftk
  ▸ slides.pdf

3 / 11

Page 3

Before we get started, let's find out what are the dependecies of *Handout-With-Script*:

1. **pdftk** - a CLI tool for manipulating PDF documents. We will use it to split the slides into pages. PDFtk Server can runs on Windows, Mac OS X and Linux, which makes our template cross-platform. click

2. **slides.pdf** - your slides for writing script for. It's not strange that you should make slides before writing scripts, right? ☺
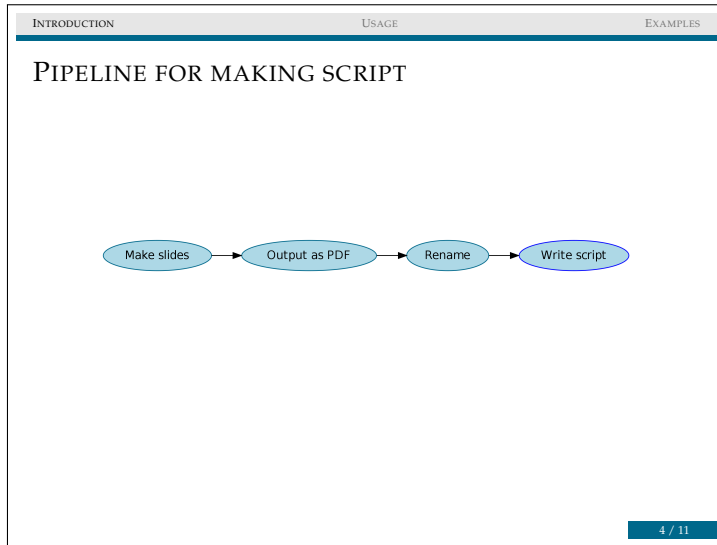

Page 4

So the pipeline of using *Handout-With-Script* goes like this:

1. Make your slides; [click]

2. Output it as pdf file. Almost all the format of slides offers the functions to export the slides as pdf format. *e.g.* Microsoft Powerpoint, Libre Office, etc. If you use LaTeX+Beamer to write slides, make sure you use the "handout" document class option, so as to output as a handout without the redundent overlay pages; [click]

3. Rename it as `slides.pdf` and put it into the same folder as `script.tex`; [click]

4. Write your script!

USAGES

- Environments:
  1. myscriptpage
  2. myscript
- Command:
  1. \click

5 / 11

Page 5

Handout-With-Script is very simple and there are only 3 usages you need to keep them in mind. First of all, it offers 2 LaTeX environments:

The first one is `myscriptpage`, which 1) creates a new page where you can write your script, and 2) inserts a slide at the top of the page. The slide comes from a specified page from `slides.pdf`. When using it, a page number is also needed to point out which slide to insert. [click]

But most of the time you **DO NOT** have to explicitly point out the page number! An intuitive way to liberate us from typing such stupid numbers is that we always play the slides page-by-page, in other words, incrementally! So here comes another environment called `myscript`, which inserts a slide that implicitly specified by a page counter. When you finished writing the script of this page by ending as `\end{mycript}`, the page counter will automatically be added with 1 so as to point to next page.

Also we offer a command `\click`, which will output a sweet [click] icon that indicates a mouse clicking. It will be useful for some slides that contains many layouts and animations and may confuses the pre-

senter when to click the mouse.

In the following slides we will show some examples of the above two environments.
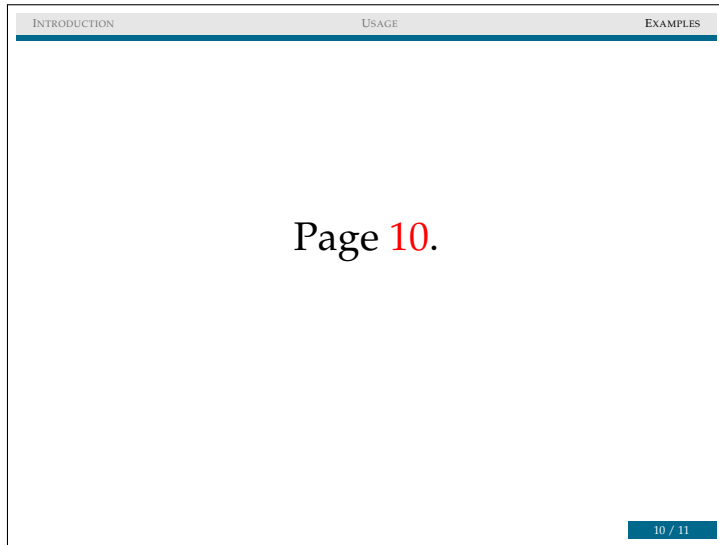

Page 10

This page will insert the slide 10.

```
\begin{myscriptpage}{10}
  This page will insert the slide 10.
\end{myscriptpage}
```
